

SELECTED ASCOMYCOTA AND BASIDIOMYCOTA FROM CEDYNIA LANDSCAPE PARK (NW POLAND)

STEFAN FRIEDRICH

Abstract: In the course of mycosociological investigations carried out in the Cedynia Landscape Park in 1985–2001, 707 species of macroscopic ascomycetous and basidiomycetous fungi were found. The paper characterizes the distribution of 172 selected species of fungi. This group includes species endangered in Poland and recorded on the 'Red List' (134 species), fungi strictly protected in Poland (10 species), fungi monitored in Poland (18 species), and fungi whose distribution has been mapped in Europe (49 species).

Key words: Fungi, distribution, Cedynia Landscape Park, threat, protection, Poland

INTRODUCTION

With a view toward the eventual development of a countrywide inventory based on regional studies of species of fungi¹ strictly protected in Poland, recorded on the red list of fungi endangered in Poland, or proposed for monitoring in Poland and mapped in Europe, this work describes the distribution of such species found in the Cedynia Landscape Park (Fig. 1). Their locations are indicated on the grid square system of the *Atlas of the geographical distribution of fungi in Poland* (Wojewoda 2000).

METHODOLOGICAL REMARKS AND GENERAL CHARACTERISTICS OF THE MYCOBIOTA

Mycological research following mycosociological methods in the Cedynia Landscape Park (CPK) in 1985–1991 yielded an elaboration of the socio-logical and ecological characteristics of the myco-biota of the park's forest communities (Friedrich 1994). In the last decade the research has been continued by irregular observations. In the course

of this work, new species not recorded before have been found, as well as new localities of species already known from the area. The data obtained have been combined with the results of studies by Bujakiewicz (1997) in the Bielinek Reserve in which 31 species not registered before were collected, and with data from earlier publications (Celiński & Filipek 1958a, b; Skirgielło 1965, 1970, 1977, 1986; Šmarda 1957; Wojewoda 1979; Bujakiewicz 1989; Friedrich 1991), bringing the total number of fungi found in the Cedynia Landscape Park to 740 species. In terms of ecological groups, terrestrial fungi predominate (*ca* 45%), half of which are mycorrhizal species. Fungi growing on trees constitute over 30%, while species growing on litter and on mosses make up almost 20% of the myco-biota. This rich biota of fungi has been collected mainly in forest communities, which cover *ca* 62% of the park area. The physiographic and geobotanical characteristics of the CPK, including forest communities, were presented previously (Friedrich 1994, 1998).

Several endangered species of fungi are found in the Cedynia Landscape Park. This work presents the characteristics of 172 of these interesting species, collected in 1985–2001. The myco-biota

¹ The term fungi refers here to macroscopic ascomycetous and basidiomycetous fungi usually called macromycetes.

of the park contain 134 species recorded on the 'red list' of endangered species in Poland (Wojewoda & Ławrynowicz 1992), 10 species strictly protected in Poland, 18 species monitored in Poland and 49 species mapped in Europe. Some of the species belong to more than one of these groups. Among the endangered species, one belongs to the category Ex (extinct and probably extinct), 5 to E (endangered), 30 to V (vulnerable), 47 to R (rare) and 51 to I (of indeterminate threat). As many as 108 species are very rare and rare (found in 1–2 or 3–6 localities), and only 5 species are very common in CPK (occurring in 24–57 localities). Among the protected fungi, very rare and rare species predominate, and only *Phallus impudicus* L.: Pers. and *Sparassis crispa* (Wulfen): Fr. are very common.

Besides the species characterized in this work, 9 other endangered species have been reported from CPK by several authors (Skirgiel 1977; Šmarda 1957; Kreisel 1987; Bujakiewicz 1997): *Amanita caesarea* (Scop.: Fr.) Pers., *Boletus impolitus* Fr., *Gastrosporium simplex* Matt., *Geastrum rufescens* Pers., *Geastrum minimum* Schwein., *Conocybe ambigua* (Kühner) Singer, *Hohenbuehelia reniformis* (Meyer: Fr.) Singer, *Peniophora limitata* (Fr.) Cooke and *Montagnea arenaria* (DC.) Zeller.

LIST OF SPECIES

The nomenclature of orders is adopted after Hawksworth *et al.* (1995), and the nomenclature of species after Antonín and Noordeloos (1993, 1997), Breitenbach and Kränzlin (1986, 1991, 1995, 2000), Hansen and Knudsen (1992, 1997), Kreisel (1987), Krieglsteiner (1991a, b), Krieglsteiner (1999), Noordeloos (1999) and others. The species are presented alphabetically within orders.

For each of the species the threat category and type of occupied substrate is given. For every plant association the following information is given: number of registered occurrences and degree of abundance according to Moser's (1949) scale; date of observation of the species in the par-

ticular plant community; and number (in brackets) and list of sites where the species occurred in 1985–2000. In the case of species with persistent fruitbodies the number of occurrences and abundance is not given.

ABBREVIATIONS

Category of threat (Wojewoda & Ławrynowicz 1992): Ex – extinct and probably extinct, E – endangered, V – vulnerable, R – rare, I – of indeterminate threat, § – strictly protected species (by the Act of the Minister of Environment of September 11, 2001), Eur. – species mapped in Europe (Skirgiel 1962), PL – species monitored in Poland (Ławrynowicz 2000). Plant association: RnA – *Ribeso nigri-Alnetum*, CrF – *Carici remotae-Fraxinetum*, FA – *Fraxino-Alnetum*, FUm – *Ficario-Ulmeturn minoris*, GsCb – *Galio sylvatici-Carpinetum betuli*, LpF – *Luzulo pilosae-Fagetum*, FQp – *Fago-Quercetum petraeae*, CaQp – *Calamagrostio arundinaceae-Quercetum petraeae*, Qrp – *Querco roboris-Pinetum*, LP – *Leucobryo-Pinetum*, Sm – *Sphagnetum magellanici* (Matuszkiewicz 2001). Forest divisions (division number given after name abbreviation): K – Krzywin Forestry District, P – Piasek Forestry District, Ch – Chojna Forestry District, Ł – Łysogórkí Forestry District, M – Mieszkowice Forestry District, (+–5) – degree of abundance of fruiting bodies according to Moser (1949).
